#### CSE 115 Lab on Strings and 1D Array

1. C Program that prints the odd & the even numbers in an array separately:

```
printf("Even numbers in the array are:");
#include <stdio.h>
void main()
                                        for (i = 0; i < num; i++) {
                                            if (array[i] % 2 == 0)
                                                printf("%d \t", array[i]);
    int i, num;
    printf("Enter size of array:");
                                        printf("\nOdd numbers in the array
    scanf("%d", &num);
    int array[num];
                                        are:");
                                        for (i = 0; i < num; i++) {
                                            if (array[i] % 2 != 0)
   printf("Enter its elements\n");
                                                printf("%d \t", array[i]);
    for (i = 0; i < num; i++)
                                        }
        scanf("%d", &array[i]);
                                      }//main
```

Try yourself 1: Write a program that prints the no. of odd & no. of even numbers in an array.

2. C Program to find the largest value in a float type array:

3. C Program to read two arrays from user, add them, and then output their sum:

```
#include<stdio.h>
                                       printf("Enter 2nd array:");
                                       for (i=0; i<n; i++)
void main()
                                           scanf("%d",&b[i]);
 int i, n;
 printf("No. of elements: ");
                                       //compute sum of two arrays
 scanf("%d",&n);
                                       for(i=0; i<n; i++)
 int a[n],b[n],c[n];
                                           c[i]=a[i]+b[i];
                                           printf("\n %d+ %d=%d",a[i],b[i],c[i]);
 printf("Enter 1st array:");
  for (i=0; i<n; i++)
                                       }
      scanf("%d",&a[i]);
```

Try yourself 3: Write a program reads two arrays from user and then output their product.

## 4. C Program to read an array from user and an index and then delete the element in that index of array:

```
//shift each array element one cell
#include<stdio.h>
                                             //left, starting from index k+1
void main()
                                                 for(i=k; i<num-1; i++)
{
    int num, i, k;
                                                     arr[i] = arr[i+1];
   printf("\nEnter no of elements :");
    scanf("%d", &num);
                                                 num--; // decrease No of elements
    int arr[num];
    //Read elements in an array
                                                 printf("Array after deleting the
   printf("\nEnter %d numbers :", num);
                                             element at index: %d\n", k);
    for (i = 0; i < num; i++)
                                                 for (i = 0; i < num; i++)
                                                     printf("%d ", arr[i]);
        scanf("%d", &arr[i]);
   printf("Index of element to delete:");
                                             }
    scanf("%d", &k);
```

## 5. C Program to find the number of spaces in a string (character array):

```
#include<stdio.h>
void main()
{
    char s[100];//assume that user won't enter a string of size > 100
    int i,numSpace=0;//counter to count #of spaces
    printf("Enter a string:");
    gets(s); //read string from user
    for(i=0; s[i]!='\0'; i++) {
        if(s[i] == ' ') numSpace++;
    }
    printf("%d spaces\n", numSpace);
}
```

## **EXERCISE:**

- 1. Write a program that searches for a given value (called a <u>search key</u>) in an array and prints the first and last index in which that value appears.
- 2. Write a program that prints all the indexes in which a search key appears.
- 3. Write a program that prints ALL indexes in which the largest value of array is present.
- 4. Write a program that prints ALL indexes in which the smallest value of array is present.

# **Assignment:**

- 1. Write a program that deletes the first element in an array which matches a search key.
- 2. (Bonus marks) Write a program that deletes all the elements in an array which match a search key.
- 3. Write a C program to print the 2<sup>nd</sup> largest & 2<sup>nd</sup> smallest elements of an array.
- 4. Write a program that reads the size and elements of an float array from user and then computes the average of the numbers in it and prints it. Then it should compute number of elements which are greater than average and prints those elements. Sample input/output:

Enter array size: 5

Enter elements: 12 13 16 15 14

Average = 14.000000, The elements greater than average are: 16, 15

- 5. Write C program to check if an input string is a palindrome (e.g. "madam", "dad", etc.) or not.
- 6. Write C program to count the number of capital letters and the number of small letters in an input string and print those numbers.
